

# $k$ -consistency

- ▶ A CSP is  $k$ -consistent if, for any consistent assignment to  $k - 1$  variables, there is a consistent assignment for the  $k^{th}$  variable.
- ▶ 2-consistency is same as arc consistency.
- ▶ 3-consistency is same as path consistency.
- ▶ A CSP is strongly- $k$ -consistent if it is  $k$ -consistent and is also  $(k - 1)$ -consistent,  $(k - 2)$ -consistent,  $\dots$  all the way down to 1-consistent.

Does  $k$ -consistent CSP  $\Rightarrow$  strongly- $k$ -consistent CSP?

Does  $k$ -consistent CSP  $\Rightarrow$  strongly- $k$ -consistent CSP?

► Is the above CSP 3-consistent?

# Does $k$ -consistent CSP $\Rightarrow$ strongly- $k$ -consistent CSP?

- Is the above CSP 3-consistent?
- Is the above CSP strongly-3-consistent?

# Strongly- $n$ -consistent

- ▶ Making a CSP strongly- $n$ -consistent can take time exponential in  $n$ .

# Strongly- $n$ -consistent

- ▶ Making a CSP strongly- $n$ -consistent can take time exponential in  $n$ .
- ▶ But, suppose that we have a strongly- $n$ -consistent CSP.

# Strongly- $n$ -consistent

- ▶ Making a CSP strongly- $n$ -consistent can take time exponential in  $n$ .
- ▶ But, suppose that we have a strongly- $n$ -consistent CSP.
- ▶ We can find a solution in polynomial time.

# Backtracking Search for CSPs

**Figure 6.1** (a) The principal states and territories of Australia. Coloring this map can be viewed as a constraint satisfaction problem (CSP). The goal is to assign colors to each region so that no neighboring regions have the same color. (b) The map-coloring problem represented as a constraint graph.
