- State and State space

Objective function: Cost vs. Fitness

3 2 7 4 8 5 5 2

- ▶ State and State space
- ▶ Cost function $h = 5$

Objective function: Cost vs. Fitness

3 2 7 4 8 5 5 2

- ▶ State and State space
- ▶ Cost function $h = 5$
- ▶ Fitness function = $\binom{8}{2} - 5 = 23$

8 Queens Problem: 3 states

S1

S2

S3

Soln.

8 Queens Problem

- ▶ Total possible number of states?

$$8 \times 8 \times \dots \times 8 \\ = 8^8$$

8 Queens Problem

- ▶ Total possible number of states?
- ▶ How many neighbours does each state have?

$$7 \times 8 = 56$$

8 Queens Problem

- ▶ Total possible number of states?
- ▶ How many neighbours does each state have?
- ▶ Objective function?

Four search algorithms

Steepest ascent Hill climbing algorithm

function HILL-CLIMBING(*problem*)

→ *current* ← MAKE-NODE(*problem*.INITIAL-STATE)

loop do

neighbor ← a highest-valued successor of *current*

if *neighbor*.VALUE ≤ *current*.VALUE **then return** *current*.STATE

current ← *neighbor*

Steepest ascent Hill climbing algorithm

function HILL-CLIMBING(*problem*)

current \leftarrow MAKE-NODE(*problem*.INITIAL-STATE)

loop do

neighbor \leftarrow a highest-valued successor of *current*

if *neighbor*.VALUE \leq *current*.VALUE **then return** *current*.STATE

current \leftarrow *neighbor*

- Will this always work?

8-queens state

18	12	14	13	13	12	14	14

14	14	13	17	12	14	12	18

- ▶ 17 pairs of queens are in attacking position for the state on the left.
- ▶ After five steepest ascent steps, we reach a local maximum.

Landscape of the state-space

Possible solutions

- ▶ Sideways move

Possible solutions

- ▶ Sideways move
- ▶ N-consecutive sideways move

100

14%

94%.

Possible solutions

- ▶ Sideways move
- ▶ N-consecutive sideways move
- ▶ Stochastic hill climbing

Possible solutions

- ▶ Sideways move
- ▶ N-consecutive sideways move
- ▶ Stochastic hill climbing
- ▶ Random-restart hill climbing

Question

- Suppose, we have a coin that gives a head with probability p . Suppose we repeatedly toss the coin. What is the expected number of coin tosses before we get a heads?

$$E(x) = p \times 1 + (1-p)[E(x)+1]$$

$$E(x) = \frac{1}{p}$$

Question

- ▶ Suppose, we have a coin that gives a head with probability p . Suppose we repeatedly toss the coin. What is the expected number of coin tosses before we get a heads?
- ▶ Suppose, steepest-ascent hill climbing succeeds in reaching the goal state with probability p . What is the expected number of starts required before the random-restart hill climbing will succeed?

$$14\% = .14$$

$$\frac{1}{.14}$$

Question

- Suppose, on average hill climbing succeeds in 4 steps and gets stuck (i.e. fails) in 3 steps. What is the expected number of **steps** before random-restart hill climbing will succeed? Assume probability of success to be .14.

$$\frac{1}{.14} \quad E(F+S) = \underbrace{E(F)} + \underbrace{E(S)}$$

$$= \underbrace{4 + \left(\frac{1}{.14} - 1 \right) \times 3}$$

$\frac{1}{p} > 1$

∴ 22 steps

Hill-climbing

- ▶ When will random-restart hill-climbing succeed in finding a good solution?
- ▶ Can we use it to solve the SAT problem? How can we define the state space?

$$(a \vee b \vee c) \wedge (\neg e \vee f) \quad \leftarrow 2^5 = \underline{32}$$
$$\underbrace{\hspace{10em}}_{2^3} \quad \underbrace{\hspace{10em}}_{2^2}$$
$$7 \quad \times \quad 3 = \underline{21} \leftarrow$$
